

UNDAMPED PROPAGATION OF ELECTROMAGNETIC SURFACE WAVES ON THE INTERFACE BETWEEN LEFT-HANDED METAMATERIAL AND DISSIPATIVE DIELECTRIC

Contact Phone

Abstract

The properties of surface electromagnetic waves (SEW) propagating along a planar structure consisting of an ideal dielectric, a dielectric layer with large losses and a high dielectric constant, and a left-handed metamaterial with “amplification” are studied. All media are isotropic. Dispersion relations for the eigenmodes of such a waveguide structure are obtained. The possibility of full compensation of the energy losses of surface waves is demonstrated.

Type of Book of Abstracts

Primary authors: Dr GALAYDYCH, Viktor (V. N. Karazin Kharkiv National University); Dr AZARENKO, N. (Karazin Kharkiv National University); Dr OLEFIR, V. (V. N. Karazin Kharkiv National University); SPOROV, A. (V. N. Karazin Kharkiv National University)

Presenter: Dr GALAYDYCH, Viktor (V. N. Karazin Kharkiv National University)

Session Classification: Laser Physics and Optoelectronics

Track Classification: Laser Physics and Optoelectronics
